

Led street lighting: safety, sustainability, profitability, beauty

The measure of civilization of a society can take any of the habits or aspirations of the people. If the city does not have separate bins for each type of waste to civilization here is still far. If streets are not lit it is a sign of a cave century if authorities do not hurry creaky old lights to change to led street lighting output the same stalemate continues. Without waiting for the municipality to decide on changes, you can build a developed a mini-civilization in their area to purchase led luminaires for outdoor lighting standard mesh or duraflex for decorative lighting and feel in your garden comfortably cozy and safe even in the dark. The contents Late evening or night when they moonless dark and surly has always been associated with something scary and unpleasant night begin to wield thieves and hooligans in the night every shadow takes on the shape of the evil forces in the dark can be injured by stepping on a sharp hidden bough or got kicked in the ditch. For ease of movement on the ground in the dark time of the day people need high-quality artificial light. The level of light helps to navigate in space and to perceive the surrounding objects, increases security and gives the accommodation in the village a certain degree of comfort. Shrugging, not understanding the difference between traditional street lighting and the latest led continue, except that hardened conservatives or those who are and conventional lamp for a hundred years not seen on the outside and modern and didn't hear anything. For such individuals I hasten to inform you that pedantic Germans positivity accustomed to all the details especially relating to the benefits and security began replacement of sodium lights with led in 2012, is already fully whole country by connecting to the process and Austria switched to the newest type of lighting. Now the inhabitants of these countries offer not just a quality system osveshenie and cost-effective long lasting environmentally friendly source of light. At the time, environmentalists from Germany by traditional calculations and studies came to the conclusion that if you leave the street lighting at the same level at which it was until 2010 that the atmosphere will be thrown not less than 320 thousand tons of carbon dioxide and it is only through the efforts of the traditional lights. First in line for replacement were the most dangerous mercury lamp against which had long ago protested European environmentalists. A wave of high-tech lighting gradually reached the post-Soviet space is now taking the decision to resume street lighting lost in the heat of the 90s
