We will be in touch +7 812 985-01-39 To grow plants need not only water and nutrients and need another quality fitoveta. Experts in the field of protected ground saying that lighting plays a big role in the proper cultivation of seedlings and vegetables. Characteristics of such equipment can greatly affect the yield and quality of the plants themselves. Lamps as our and foreign production, intended for lighting and lighting of plants and also provide the best light distribution. On the basis of the greenhouse area needs in such equipment and Finance you always have the option to choose the lighting option that will be most optimal for you. The role of artificial lighting for plants is very large. Good light helps plants to develop, leads to an increase in foliage volume of vegetative growth. Therefore, the quality of the harvest depends largely on what kind of lighting you use in greenhouses. For artificial lighting use lamps, sodium high pressure. They provide an opportunity to monitor the growth of plants and to obtain a high yield. Waves from such lamps is well captured by plants and this affects their growth. Ballasts electronic ballasts and EMPRA from domestic and foreign firms designed for use with lamps Gnats and dries. The additional installation of another and the intermediate devices and in addition is well protected from power surges in the network. The lamps are made exclusively for use in greenhouses as another source of light radiation as a method of extending the light of day. They can also be used to replace ordinary light to completely control the lighting conditions. Mode of operation 0800 - 2200 weekends Phone +7812985-01-39 Email infogrowvit.ru
